POCI — verification card

Four checks. Two minutes. Do them before the demo, not during it.

---

0 · First, make sure you are running the fixed build

A hard reload is required — your tab has the old engine in memory, and the browser may also have it cached.

Hard reload: `Cmd + Shift + R` (Mac) · `Ctrl + Shift + R` (Windows)

Then in the console (`Cmd+Opt+J`) run:

```
pcsVersion()
```

It **prints a table and returns `{}`** — read the printed output, not the return value. You want:

```
label         V4.69 · 2026.10.20
manifest      V4.69 · built 2026-10-20T...
loan-module-engine.js   ... 'current'
All 8 deployed files match the manifest.
```

The version badge on its own is not enough — the HTML carries the label, so the page can say V4.69 while running a cached engine beside it. That is exactly how two accounting fixes went missing before. If the table marks `loan-module-engine.js` **STALE**, the fix has not reached your browser: hard-reload again, and if it persists the files need deploying.

> Fixed in V4.69: the runtime list is now derived from the manifest, so it cannot drift from it again. Before V4.69 it checked 7 of 8 files and never hashed `demo-assistant-kb-ifrs.js`.

If the page says V4.67: you are on a deployed copy that has not been updated. Run `./deploy.sh <webroot>` from the repo root, then reload. *If the URL is `localhost:8080` or similar pointed at the repo*, a hard reload is all that is needed — there is nothing to deploy.

---

1 · `DEMO-POCI-PAR` — the one you can check in your head

Check	Expected
Credit-adjusted EIR	**13.3333%**
Carrying value, every year end	**60,000,000.00** — flat, exactly
Accretion	**0.00**

13.3333% = 8.00% × 100,000,000 / 60,000,000. The coupon grossed up by what you actually paid. If this deal is right, the solve is right.

---

2 · `DEMO-POCI-MID` — convergence

Check	Expected
Credit-adjusted EIR	**16.2241%**
Carrying value at maturity (31 Dec 2031)	**78,000,000.00** — exactly, not 80.4m
Accretion over life	**18,000,000.00**

This is the one that was broken: it used to finish at **80,379,504.83**, a 3.05% overshoot. If you see anything near 80m you are still on the old engine — go back to step 0.

Identity check, on the Cashflow tab with *Accreted to date* and *Unaccreted* side by side — at **any** period the two must sum to 18,000,000:

	accreted	unaccreted	sum
end 2026	1,911,008.89	16,088,991.11	18,000,000.00
end 2029	9,958,099.74	8,041,900.26	18,000,000.00

---

3 · `DEMO-POCI` — the 2028 revision

Check	Expected
Credit-adjusted EIR	**15.7803%**
ECL allowance before 1 Jan 2028	**0.00**
ECL allowance from 1 Jan 2028	**(10,000,000.00)** — negative
Net carrying > gross carrying from that date	yes — 73,513,378.23 against 63,513,378.23
EIR on either side of the revision	**unchanged at 15.7803%**

The last row is the IFRS 9 point: a POCI asset's credit-adjusted rate is **never** revised (§B5.4.7). The revision lands entirely in the allowance.

---

4 · All three — day one

Check	Expected
Day-one ECL allowance	**nil** on all three
Gross carrying at 1 Jan 2026	**60,000,000**, not 100,000,000
EIR shown	the credit-adjusted rate, **never 8.00%**

Still open — do not demo these

- **#71** — the maturity leg repays **face**. Correct on `DEMO-POCI`, wrong on `MID` and `PAR`. **Stop before the maturity journal on those two.**
- **#72** — POCI deals still show "Stage 1". It is a display default, not a measurement. POCI has no stages.

If a number disagrees

Tell me which deal, which figure, what the screen says. Do not adjust the script to match the screen — the figures in it are engine output as of 20 October 2026 and all three deals converge to 0.00 drift. A disagreement means either the build is stale (step 0) or something changed after that date, and both are worth knowing about before a client sees it.
