PCS Loan Module — Database Schema Reference

Read from the live database, 16 October 2026. PostgreSQL 17 · 80 tables · 7 views · 236 RLS policies · **57 enum types** · 112 migrations · 28 functions · 24 triggers · 244 indexes · 139 foreign keys · 49 check constraints.

> **Changed since the 12 October reading.** Three tables added — `maturity_extensions`, `holiday_calendars`, `holiday_dates`. Six columns added — `deals.workday_investment_id`, `gl_event_mappings.is_suppressed`, `treatment_overrides.stage1/2/3_start_date`, plus the extension table's own. One enum gained a value (`fee_kind` → `legal`) and **one enum was retired**: `facilities.holiday_calendar` is now `text` with a foreign key onto `holiday_calendars(code)`. The table inventory and enum list below have been spot-corrected; the per-table row counts are from 12 October and will have drifted.
>
> **This is a reference, not a rebuild script.** To recreate the database use the Supabase CLI, which captures functions, triggers, grants, sequences and extensions that a reconstructed DDL dump silently omits:
>
> ```
> supabase link --project-ref prljhhyfgzipjnfpztfu
> supabase db dump --schema public > schema.sql
> supabase db dump --schema public --data-only > seed.sql
> ```

Table inventory

Columns, RLS policies and current row counts. Row counts show which tables carry demo data and which are reference data.

TABLE	COLS	POL	ROWS

```

The tables that matter most

- **`deals`** (58 cols) — the deal master. `source` distinguishes internal from external.
- **`treatment_overrides`** (61 cols) — every accounting policy decision per deal: EIR method, ECL stage, PD/LGD, POCI flags and lifetime ECL, modification threshold, hedge designation. This is where the accounting judgements live.
- **`accounting_runs`** / **`journal_entries`** — a run and its output. One current run per deal.
- **`cashflow_schedules`** — the daily schedule, one row per day per run. The largest table by far.
- **`external_snapshots`** / **`external_cashflows`** — imported deals. A snapshot is complete and immutable; changes are detected by diffing.
- **`gl_event_mappings`** — business event to debit/credit account, per framework. Drives journal mapping and is client-configurable.

Access control

Row-level security on **all 80 tables**, enforced through three helpers:

Helper	Grants
`is_admin()`	Admin override across the workspace
`in_team(team_id)`	Team-scoped workspace configuration
`owns_deal(deal_id)`	Per-deal access via `deal_user_assignments`

Typical pattern, from `gl_event_mappings`:

```
create policy gl_event_mappings_read on public.gl_event_mappings
  for select to authenticated
  using (team_id is null or is_admin() or in_team(team_id));

create policy gl_event_mappings_write on public.gl_event_mappings
  for all to authenticated
  using      (is_admin() or (team_id is not null and in_team(team_id)))
  with check (is_admin() or (team_id is not null and in_team(team_id)));
```

Workspace defaults are rows with `team_id IS NULL` — readable by all, writable by admins.

Audit before production. Some early policies grant `{anon, authenticated}` with `using (true)` — a demo-phase hangover. `rfr_fixings` is one. Find them all:

```
select tablename, policyname, roles, qual
from pg_policies
where schemaname = 'public' and 'anon' = any(roles)
order by tablename;
```

Enum types (57)

```
create type public.aasb_tier_kind as enum ('tier1', 'tier1RDR', 'tier2');

Migration history (112)

The schema was built incrementally. The names read as a development log.

The eleven applied on 14–15 October, newest last:

```
20261014144324  add_maturity_extensions_table
20261014144340  backfill_maturity_extensions_from_deals
20261014153531  gl_event_mappings_add_is_suppressed
20261014194835  deals_add_workday_investment_id
20261014195404  holiday_calendars_config_tables
20261014195431  holiday_dates_uniq_nulls_not_distinct
20261014195512  seed_holiday_dates_2024_2035
20261014200013  facilities_holiday_calendar_enum_to_fk_v2
20261014204343  treatment_overrides_stage_start_dates
20261014205152  create_poci_demo_deals_2_and_3_v2
20261015184447  fee_kind_add_legal
```

Two of those are worth reading before you rely on the schema. `holiday_dates_uniq_nulls_not_distinct` exists because Postgres treats NULLs as distinct in a unique constraint by default, and every seeded row has `team_id IS NULL` — the original constraint would have allowed the 611 seed rows to be inserted any number of times, silently. `facilities_holiday_calendar_enum_to_fk_v2` is the type change described at the top of this document, and it also repoints seven deals from `auFederal` to `auNational`, which changes their payment dates.
